

¿Cómo hacer la bibliografía de tu tesis en 6 clicks o menos?

Una breve introducción a Zotero

Víctor Miguel García Sánchez

13 de abril de 2020

Para la realización de carteles, reportes, tesis y, naturalmente, papers, la mayoría usamos L^AT_EX, y en los mismos requerimos ser formales al justificar nuestras fuentes.

Para la realización de carteles, reportes, tesis y, naturalmente, papers, la mayoría usamos L^AT_EX, y en los mismos requerimos ser formales al justificar nuestras fuentes.

Aún dejando de lado la constante actualización de APA (o el estilo de citado que usemos), mantener una gestión adecuada de la bibliografía puede llegar a ser complicada.

A new microstructure noise index.

Quantitative Finance, Vol. 11, No. 6, June 2011, 883-899

Routledge Taylor & Francis Group

A new microstructure noise index

MATHIEU ROSENBAUM*

CREST and CMAP-École Polytechnique Paris, Route de Saclay,
91128 Palaiseau Cedex, France

(Received 21 April 2008; in final form 18 November 2009)

We introduce a new microstructure noise index for financial data. This index, the computation of which is based on the p -variations of the considered asset or rate at different time scales, can be interpreted in terms of Besov smoothness spaces. We study the behavior of our new index using empirical data. It gives rise to phenomena that a classical signature plot is unable to detect.

Título Estimating the number of ozone peaks in Mexico City using a non-homogeneous Poisson model

Autor Achcar, Jor... Autor Fernández, Ad... Autor Rodríguez, Eli... Autor Tzintzún, Gu...

Resumen In this paper, we consider the problem of estimating the number of times an air quality standard is exceeded in a given period of time. A non-homogeneous Poisson model is proposed to analyse this issue. The rate at which the Poisson events occur is given by a rate function $\lambda(t)$, $t \geq 0$. This rate function also depends on some parameters that need to be estimated. Two forms of $\lambda(t)$, $t \geq 0$ are considered. One of them is of the Weibull form and the other is of the exponentiated-Weibull form. The parameters estimation is made using a Bayesian formulation based on the Gibbs

A non-homogeneous Poisson model is proposed to analyse this issue. The rate at which the Poisson events occur is given by a rate function  $\lambda(t)$ ,  $t \geq 0$ . This rate function also depends on some parameters that need to be estimated. Two forms of  $\lambda(t)$ ,  $t \geq 0$  are considered. One of them is of the Weibull form and the other is of the exponentiated-Weibull form. The parameters estimation is made using a Bayesian formulation based on the Gibbs sampling algorithm. The assignation of the prior distributions for the parameters is made in two stages. In the first stage, non-informative prior distributions are considered. Using the information provided by the first stage, more informative prior distributions are used in the second one. The theoretical development is applied to data provided by the monitoring network of Mexico City. The rate function that best fit the data varies according to the region of the city and/or threshold that is considered. In some cases the best fit is the Weibull form and in other cases the best option is the exponentiated-Weibull. Copyright © 2007 John Wiley & Sons, Ltd.},

Summary: "Estimating **volatility** from recent high frequency data, we revisit the question of the self-similarity of the process. Our main result is that log-**volatility** behaves essentially as a fractional Brownian motion with Hurst parameter $H > 0.1$, at any reasonable timescale. This leads us to adopt the fractional stochastic **volatility** (FSV) model with long memory in continuous-time stochastic **volatility** models. *Math. Finance*, 1998, **8**(4), 291–323" [MR1658331]. We introduce the **Rough FSV** (RFSV) to underline that, in contrast to FSV, $H < 1/2$. We demonstrate that our RFSV model is able to fit financial time series data; one application is that it enables us to obtain improved forecasts of future volatility. We find that although **volatility** is not a long memory process in the RFSV model, classical statistical tests of long memory tend to conclude the presence of long memory in data generated from it. This finding of **volatility** has been widely accepted as a stylized fact."
